## Question 4

Q: How does Femtet specify the direction of materials?

A: The direction of materials is specified on the [Direction] tab in the [Edit Body Attribute] dialog box. In the piezoelectric analysis, it is specified by either vector or Euler angle.

Please refer to the Femtet help menu below for more information. Home >How to Set Body Attribute, Material Property, and Boundary Condition >Body Attribute Tabs >Direction Tab

Additional information is provided on the next slides.

■ To specify the direction of materials, Femtet uses two types of specifying methods: [Vector] and [Euler Angle].

- If a material has one special axis and two other physically equal axes, [Vector] is recommended. If a material is a polarized polycrystalline material, [Vector] is better than [Euler Angle] for easy setting.
■ If a material is single crystal material, [Euler Angle] is recommended.
- Be aware that the specifying methods of [Vector] and [Euler Angle] are different.

## Specify by [Vector]

Specify a vector indicating the Z direction of a material.

## Specify by [Euler Angle]

Specify rotation angles of the coordinate system of a model based on or by fixing the coordinate system of a material.

| Direction |  |
| :--- | :---: |
| Specified by |  |
| OVector | Centripe <br> (Radial) |
| O:Euler Angle | Circumfe |

## Definition of Euler Angle

- By using Euler angles, one coordinate system can be transferred to another coordinate system. The transformation consists of three rotating operations.
$\square$ There are multiple methods to define Euler angles. Femtet uses a widely used $\mathrm{z}-\mathrm{x}-\mathrm{z}$ convention.

■ Rotation Procedure in the Z-X-Z Convention

From Wikipedia

1. Rotate ( $x, y, z$ ) about $z$-axis by an angle of $\alpha$, turning into ( $x^{\prime}, y^{\prime}, z^{\prime}$ ).
2. Rotate ( $x^{\prime}, y^{\prime}, z^{\prime}$ ) about $x^{\prime}-$ axis by an angle of $\beta$, turning into ( $x^{\prime \prime}, y^{\prime \prime}, z^{\prime \prime}$ ).
3. Rotate ( $x^{\prime \prime}, y^{\prime \prime}, z^{\prime \prime}$ ) about $z^{\prime \prime}$-axis by an angle of $\gamma$, turning into (X, Y, Z).

## Definition of coordinate systems of material and model

- The coordinate system to determine anisotropic materials is defined as [Coordinate System of a Material]. In the material property dialog box of Femtet, the axis of materials is represented in ( $\mathrm{x}, \mathrm{y}, \mathrm{z}$ ).
■ The coordinate system of the entire model is defined as [Coordinate System of a Model].
Example of material property (Elasticity)

| Elasticity matrix (compliance) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| xx | 0.76 | 0.76 |  | X10 | -11 | 1/Pa |
| yy | -0.76 |  |  |  |  |  |
| zz | -0.17 | -0.17 | 0.82 |  |  |  |
| yz | 0 | 0 | 0 | 1.85 |  |  |
| zx | 0 | 0 | 0 | 0 | 1.85 |  |
| xy | 0 | 0 | 0 | 0 | 0 | 1.85 |
|  | xx | y | zz | yz | zx | xy |

With no rotation operation, the coordinate system of a model will match with the coordinate system of a material.

## [Coordinate System of a Model] and [Coordinate System of a Material]

■ If the coordinate systems of a model and a material are different, the transformation between them is defined by Euler angle.

- Femtet defines Euler angle as the angle to rotate the coordinate system of a model based on the coordinate system of a model, not vice versa.
*It might seem that rotating the coordinate system of a material is easy to understand intuitively. But from the academic background, Euler angle has been defined as an angle to rotate the coordinate system of a model based on or by fixing the coordinate system of a material.

■ Rotation of Coordinate System of a Model (Euler Angle)
(1) Fix the coordinate system of a material (Reference)
(2) Rotate the model

■ In an internal calculation, the coordinate is transformed

in such a way that the coordinate system of a material is rotated.
(1) Fix the coordinate system of a model (Reference)
(2) Rotate the coordinate system of a material

## Explanation of Diagram

- Three lines, R, G, and B, represent the coordinate axes of a material, $\mathrm{x}, \mathrm{y}$, and z .

■ Three arrows, R, G, and B, represent the coordinate axes of a model, X, Y, and Z.
■ By using Euler angle, rotate the coordinate axes of a model, X, Y, and Z, based on or by fixing the coordinate axes of a material, $\mathrm{x}, \mathrm{y}$, and z .

Example: Ceramics polarized in the X direction

## Explanation

- Suppose that ceramics is polarized in the X direction.
- With Euler angle, this operation indicates the X axis of a model, the red arrow, directs to the $3^{\text {rd }}$ axis of a material, the blue line.

| Euler angle |  |
| :--- | :--- |
| $Z(\alpha)$ | 0 |
| $X^{\prime}(\beta)$ | -90 |
| $Z^{\prime \prime}(\gamma)$ | -90 |

■ This can be specified by a vector as $(1,0,0)$ as well.

Example: Ceramics rotated by $30^{\circ}$ about Y axis

## Explanation

- Suppose that the $1^{\text {st }}$ axis of a material is rotated by $30^{\circ}$ about the Y-axis of a model.
- With Euler angle, the model is rotated by $-30^{\circ}$ about the $2^{\text {nd }}$ axis,

| Euler angle |  |
| :--- | :--- |
| $Z(\alpha)$ | 90 |
| $X^{\prime}(\beta)$ | -30 |
| $Z^{\prime}(\gamma)$ | -90 | the green line, of a material

- This can be specified by a vector as $\left(\cos 30^{\circ}, 0, \sin 30^{\circ}\right)$ as well.

## Example: AT-Cut Quartz

■ Euler angle if AT-cut quartz element is adhered on the XY plane.
■ The X-axis, the red arrow, of a model matches with the $1^{\text {st }}$ axis, the red line, of a material.

| Euler angle |  |
| :--- | :--- |
| $Z(\alpha)$ | 0 |
| $X^{\prime}(\beta)$ | -55 |
| $Z^{\prime}(\gamma)$ | 0 |

Reference: ST cut ( $X^{\prime}=-48$ ), CT cut $\left(X^{\prime}=-52\right)$, BT cut $\left(X^{\prime}=41\right)$, DT cut $\left(X^{\prime}=38\right)$

Quartz
Cutting angle

## Example: AT-Cut Quartz

- Euler angle if AT-cut quartz element is adhered on the YZ plane.

| Euler angle |  |
| :--- | :--- |
| $Z(\alpha)$ | 90 |
| $X^{\prime}(\beta)$ | 90 |
| $Z^{\prime}{ }^{\prime}(\gamma)$ | 35 |

■ The Z-axis, the blue arrow, of a model matches with the $1^{\text {st }}$ axis, the red line, of a material.
